MODUL 6 (User Input)

THEME DESCRIPTION

Students will learn about reusable input field.

WEEKLY LEARNING GOAL (SUB-GOAL LEARNING)

Student understand how to handle user input in application development.

SOFTWARE / HARDWARE REQUIREMENTS

1. Laptop / PC
2. IDE (Android Studio/XCode)
3. Code Editor (Visual Studio Code/Sublime/etc)

PRACTICUM STEPS

1. Duplicate the Week 1 project and create a new repository link for Week 6
2. Modify the **index function** in the `index.tsx` file as shown below

```
export default function Index() {  
  const [name, setName] = useState("");  
  
  const handleChangeMyName = (value: string) => {  
    setName(value);  
  }  
  
  return (  
    <View style={styles.container}>  
      <Text>Febe Febrita - 111111.</Text>  
    </View>  
  );  
}  
  
const styles = StyleSheet.create({  
  container: {  
    backgroundColor: "#fff",  
    alignItems: "center",  
    justifyContent: "center",  
    flex: 1,  
    gap: 8  
  }  
});
```

3. Create a **CustomTextInput** component so that **Name** becomes an input field

```

1  import { useState } from "react";
2  import { StyleSheet, Text, TextInput, View } from "react-native";
3
4  interface CustomProps {
5    input: string;
6    onChange: (val: string) => void;
7  }
8
9  const CustomTextInput = ({
10    input,
11    onChange
12  }: CustomProps) => {
13    console.log(input);
14
15    return (
16      <View>
17        <Text>Name</Text>
18        <TextInput
19          placeholder="Input your name"
20          style={{
21            borderColor: "black",
22            borderWidth: 1,
23            padding: 10,
24            borderRadius: 8
25          }}
26          onChangeText={onChange}
27        />
28      </View>
29    );
30  };

```

4. Remove the previously **hardcoded name** and replace it with a **variable named name**. Then add the **CustomTextInput** component that was created earlier into the **index function**

```

export default function Index() {
  const [name, setName] = useState("");

  const handleChangeMyName = (value: string) => {
    setName(value);
  }

  return (
    <View style={styles.container}>
      <Text>{name} - 11111.</Text>
      <CustomTextInput input={name} onChange={handleChangeMyName}/>
    </View>
  );
}

```

5. Create a **NIMInput** component so that **NIM** becomes an **input field**.

```
const NIMInput = ({
  input,
  onChange
}: CustomProps) => {
  console.log(input);

  return (
    <View style={{width:200}}>
      <Text>NIM</Text>
      <TextInput
        placeholder="Input your NIM/Student ID"
        style={{
          borderColor: "black",
          borderWidth: 1,
          padding: 10,
          borderRadius: 8
        }}
        onChangeText={onChange}
        keyboardType="numeric"
      />
    </View>
  );
};
```

ASSIGNMENT

1. Remove the hardcoded NIM previously used in the index function, replace it with a new variable, and use NIMInput as the input field.
2. Move the CustomTextInput and NIMInput components that have been created into a new file named input.tsx, then import and use those components in index.tsx.

For the submission:

1. Create a Git repository with the name Week6_[NIM]_[Name].
2. Push your project files to the repository.
3. Copy the repository link and paste it into Week6_[NIM]_[Name].txt
4. Submit to elearning in .txt or .zip format
